

Sensory Processing Disorder

What is a Sensory Processing Disorder and where to find help and support?

When a child doesn't respond in the way they are expected to, it could be because they are finding something too intense or overwhelming and they just can't cope. Alternatively, it could be that they need even stronger sensory activity to get the message from their senses. There are 5 senses that you will probably know: Sight, Sound, Smell, Taste and Touch, but there are also 3 more - Vestibular (movement and balance) Proprioception (body awareness) and Interoception (how our body feels inside). Sensory processing disorder acts like a traffic jam between the brain and the nervous system so the message don't get to the brain properly. This can mean they respond from one extreme to the other - so too much or hardly at all, to what is happening to them or to their surroundings. Many children with sensory processing disorder can be easily helped once you, and they, know what their sensitivities are.

How do I know if my child has sensory processing issues?

For some children, for example, the sound of a lawn mower outside the window may make them dive under the table. They may scream when touched or hate the textures of certain fabrics or even vomit. They may equally seek out extra stimulation - making noises, stamping feet or being excessively touchy feelie, for example. Others seem unresponsive to anything around them - they may fail to respond to extreme heat or cold or even pain. Whatever the experience your child is having, it is very real to them and could express itself in anxiety or challenging behaviour. It is always important to try to find out what is upsetting your child and remember that they are just reacting to the messages they are receiving. Many children show behaviours like this now and again but, when it is severe enough to make everyday life difficult, it is important to speak to someone, and to get help and advice.

Who can help?

- You will know your child well and can probably already tell what triggers the problems, what helps and doesn't help - this is as valuable as a diagnose as this is the bit that makes the real difference to everyday life.
- Your child's teacher or SENCo are a good place to start - tell them what is worrying you. . They may seek further help from an Occupational Therapist, who can make a diagnosis.
- You could speak to your GP, Health Visitor as they, too, can organise an assessment
